tifier for indicating the presence of the message of the first message service are included in a user data header of the data portion of the short message.

28. The method of claim 27, wherein the user data header is constructed in WCMP format.

29. The method of claim 1, wherein the data portion of the short message further includes an indication of a length of the message of the first message service.

30. The method of claim 29, wherein the identification of the type of the message of the first message service, the identifier for indicating the presence of the message of the first message service and the indication of the length of the message of the first message service are included in a user data header of the data portion of the short message.

31. The method of claim 30, wherein the user data header is constructed in WCMP format.

32. The method of claim 1, wherein the short message of the second message service is sent between a transmitter and a receiver.

33. The method of claim 32, wherein the transmitter is a MMS relay and the receiver is a subscriber.

34. The method of claim 1, wherein the short message of the second message service is sent between a transmitter and a receiver without line-oriented transmission.

35. The method of claim 1, wherein the first message service further comprises a dedicated second group of messages and wherein the dedicated second group of messaged of the first message service is sent between a transmitter and a receiver using line-oriented transmission.

36. The method of claim 17, wherein the identification of the type of the message of the first message service is included in a user data header of the data portion of the short message.

37. The method of claim 17, wherein the user data header is constructed in WCMP format.

38. The method of claim 17, wherein the data portion of the short message further includes an indication of a length of the message of the first message service.

39. The method of claim 38, wherein the identification of the type of the message of the first message service and the indication of the length of the message of the first message service are included in a user data header of the data portion of the short message.

40. The method of claim 17, wherein the first message service further comprises a dedicated second group of messages and wherein the dedicated second group of messaged of the first message service is sent between the transmitter and the receiver using line-oriented transmission.

41. The method of claim 17, wherein the transmitter is an MMS relay and the receiver is a subscriber.

42. The method of claim 22, wherein the elements for defining the message of the first message service comprise an identification of the type of the message of the first message service and an indication of a length of the message of the first message service.

43. The method of claim 42, wherein the elements for defining the message of the first message service further comprise an identifier for indicating the presence of the message of the first message service within the data portion of the short message.

44. The method of claim 42, wherein the header portion of the short message includes an identifier for indicating the presence of the message of the first message service within the data portion of the short message.

45. The method of claim 22, wherein the header portion of the short message includes an identifier for indicating the presence of the message of the first message service within the data portion of the short message.

46. The method of claim 22, wherein the user data header is constructed in WCMP format.

47. The method of claim 22, wherein the messages of the second message service are sent between the transmitter and the receiver without line-oriented transmission.

48. The method of claim 22, wherein the transmitter is a MMS relay and the receiver is a subscriber.
